(54) Title: A MICRO-HOLDING PIPETTE WITH AN OBLIQUE OPENING

(54) 发明名称: 吸持开口斜面型显微持卵管

(57) Abstract: The present invention relates to a micro-holding pipette. The holding end of the micro-holding pipette is an oblique opening, i.e. the surface of the opening of the holding end of the micropipette is at an acute angle with the ordinate axis of the holding end, which is less than 90° preferably is from 25° to 85°. The present invention advantages to pierce a pellucid zona from the side (not obverse surface) of an ovum or embryo by a micro injection needle or assistant needle for incubating, and without the deformation of the ovum or embryo due to the pressure. It is beneficial to various micro-processes. The novel micro-holding pipette and its operation can significantly prevent embryo from damaging and improve the healthy growth of the embryo.
